

Highlights:

Yukon's real gross domestic product in 2010 was	\$1,755,000,000
In 2009, the revised real gross domestic product was	\$1,692,000,000
The difference was an increase of	\$63,000,000
As a percentage, the increase was	3.7%

Gross domestic product (GDP) is a measure of an area's (e.g. Yukon's) total production of goods and services for a given period of time (e.g. 2010). These are goods and services which are exchanged for money in the market economy. GDP is one of the primary measures of the health of the economy. It is used for monitoring trends in economic production, forecasting economic activity and assessing the sources of economic growth or decline.

GDP can be calculated three ways; the two shown in this publication are "income-based" and "expenditure-based". (product-based GDP is covered in our GDP by Industry publication.)

- **Income-based GDP** is the sum of income produced by land, labour, capital and entrepreneurship. It is based on the idea that adding together the incomes of everything that is producing will be equal to the value of everything that is produced.
- **Expenditure-based GDP** is calculated by measuring the total expenditure of money used to buy things, using the idea that most things produced are sold. It includes the sum of all economic output, including net exports and expenditures by consumers, governments, business enterprises and non-residents.

When GDP is calculated using the prices of that year (current dollars), it is called nominal GDP. Real GDP is the same calculation, but is adjusted for inflation.

In order to obtain real GDP, prices from various years are adjusted to the equivalent of the prices in one year - a base year. We currently use a base year of 2002, so in this publication real GDP is calculated using chained 2002 dollars. **Real GDP can only be calculated in terms of expenditure** because components of income-based GDP cannot be split between a quantity value and a price value to allow for price adjustment.

Yukon's Real Gross Domestic Product

Real GDP, Yukon, 2001 to 2010
(millions of chained (2002) dollars)

Growth Rate of Real GDP, Yukon, 2001 to 2010

Over the last ten years, the Yukon economy has experienced substantial variations in real gross domestic product growth, with rates ranging from a low of -1.8% in 2003 to a high of 8.5% in 2008.

In 2010, economic production in the Yukon as measured by the GDP increased 3.7% from 2009.

Gross Domestic Product, Expenditure-based

Expenditure-based Yukon GDP, 2010 (millions of \$, current prices)			
	millions of \$		millions of \$
Personal expenditure			
on consumer goods and services	1,168	Business investment in inventories	-61

* Real GDP is adjusted for inflation; nominal GDP has not been adjusted for inflation.

GDP-Based Personal Income¹

In 2010, **personal income per person** in Yukon (based on GDP) was second-highest in Canada at \$50,551. This was an increase of \$1,803 or 3.7%, over the revised 2009 figure.

At \$41,928, Yukon also had the second-highest **personal disposable income per person** in the country in 2010. The NWT had the highest at \$44,262 while the national figure was \$29,707.

Yukon's personal savings rate of 17.7% in 2010 ranked third in Canada, behind Nunavut at 35.6% and the NWT at 24.9%. Nationally, the rate of personal savings sat at 4.8%.

Source: Statistics Canada CANSIM Tables 384-0013 and 051-0001.

¹Personal income includes wages, salaries and supplementary labour income (national basis); accrued net income of farm operators from farm production; net income of non-farm unincorporated business, including rent; interest, dividends and miscellaneous investment income, and current transfers from government, corporations and non-residents. Personal disposable income includes personal income, less direct personal taxes, contributions to social insurance plans and other current transfers to government.

Income from Labour Supplement

Income from labour is the largest component of Yukon's income-based gross domestic product (GDP). The labour income component of income-based GDP is made up of two categories: wages and salaries, and supplementary labour income.

Wages and salaries is an aggregate of many types of payments made to employees. In addition to regular remuneration, it includes directors' fees, bonuses, commissions, gratuities, income in kind, taxable allowances, retroactive wage payments and stock options. Wages and salaries are estimated on a "gross" basis, that is, prior to deductions for employees' contributions to income tax, employment insurance, pension funds etc.

Supplementary labour income is defined as payments made by employers for the future benefit of their employees. It contains employer contributions to employee welfare, pensions, workers' compensation and employment insurance.

Note: earnings received by self-employed persons or working owners of unincorporated businesses are not included in labour income.

In 2010, the labour income component of total GDP (49.6%), was comprised of 42.8% from wages and salaries and 6.8% from supplementary labour income.

Source: Statistics Canada, CANSIM 384-0001 and 382-0006.

¹"Other" includes remaining income-based GDP components: corporation profits before taxes, interest and miscellaneous investment income, accrued net income of farm operators from farm production, net income of non-farm unincorporated business (including rent), inventory valuation adjustment, taxes less subsidies on factors of production and on products, capital consumption allowances and statistical discrepancy.

GDP from Labour Income by Industry

Yukon Wages and Salaries (\$000s)

Of the total Yukon GDP wages and salaries, service-producing industries comprised the major source in 2010 at \$823,932,000, or 82.6%. The other source of GDP wages and salaries, goods-producing industries, comprised \$173,938,000, or 17.4%.
